

Sample Data with Image

This document is basically a test drive for PDF extraction tools. We made it to create a controlled space where we can really put different data extraction tools and algorithms through their paces. We're looking at how accurate, complete, and efficient they are. The content itself is designed with common PDF elements that can be tricky to extract, things like different fonts, images, tables, and even some complex formatting. This standard sample helps developers and QA folks spot weaknesses, make their extraction solutions tougher, and ensure we can reliably pull data from real PDF files.

Sample equation: $2 + 2 = 4$
